

Services Guide & Technical Blueprint

Building Scalable Backends, Type-Safe Frontends, and Leading High-Performance Teams

ujjwal24@iitk.ac.in | github.com/RDisBackkk

Core Architecture & Services

I build software that doesn't break under load. If you need clean Next.js frontends or highly concurrent Go/PostgreSQL backends that handle spikes gracefully, here is how I work.

High-Concurrency Backend Engineering

- **Go / Gin & PostgreSQL:** I write backend APIs optimized for speed, keeping response times under 200ms.
- **Database Optimization:** Query performance tuning, index strategies, and clean schema migrations that protect live user data.
- **Infrastructure & Containers:** Docker, Redis caching, and cloud deployments designed to run with 99.9% uptime.

Performance-Driven Frontend Development

- **Next.js & React:** Highly interactive, clean interfaces built with strict TypeScript and modern animation engines (Framer Motion, GSAP).
- **Production Styling:** Clean, responsive, and maintainable CSS layouts that prioritize user experience and fast page speeds.

Team Leadership & Architecture Consulting

- **Process Optimization:** Standardizing code reviews, API schemas, and Git workflows to accelerate shipping speeds by 25%.
- **Mentorship:** Helping junior developers write cleaner code and building structured technical education resources.

Track Record & Systems in Production

I don't ship mock projects. The tools I build are used daily by thousands of people.

IIT Kanpur Placement Portal (RAS)

As Lead Software Engineer and Team Lead, I maintain the core portal used by over 20,000 students and top global recruiters. I manage a team of 4 engineers and oversee a production codebase exceeding 37,000 lines of code.

Placement Interview Management System (PIMS)

I built and deployed an automated QR-based interview scheduling system ahead of critical deadlines. It handled 1,000 to 2,000 active users daily from day one, replacing slow, error-prone manual scheduling and saving hundreds of operational hours.

Full-Stack Instructor (RAS.DEVCAMP)

Designed and taught a comprehensive 10-week Full-Stack bootcamp for over 57 enrolled IIT Kanpur undergraduates, covering system design, Next.js, Go, and deployment. Received outstanding feedback for structured resources and hands-on guidance.

Working Together

Every project I take on starts with clear milestones and defined scopes. No fluff, no endless meetings.

1. **Discovery Call:** We map out your system bottlenecks, scalability needs, or layout targets.
2. **Technical Specification:** I deliver a short PDF explaining the exact stack, database schema, and interface design I will build.
3. **Milestone-Based Delivery:** Code is shipped iteratively in clean, tested pull requests.
